1. Import packages and get data

```
library(tidyverse)
```

```
## -- Attaching packages --------------------------------------- tidyverse 1.3.2 --
## v ggplot2 3.3.6      v purrr   0.3.4
## v tibble  3.1.8      v dplyr   1.0.10
## v tidyr   1.2.1      v stringr 1.4.1
## v readr   2.1.2      v forcats 0.5.2
## -- Conflicts ------------------------------------------ tidyverse_conflicts() --
## x dplyr::filter() masks stats::filter()
## x dplyr::lag()    masks stats::lag()
```

```
library(nycflights13)
library(sp)
library(sf)
```

```
## Linking to GEOS 3.10.2, GDAL 3.4.2, PROJ 8.2.1; sf_use_s2() is TRUE
```

```
data(flights)
str(flights)
```

```
## tibble [336,776 x 19] (S3: tbl_df/tbl/data.frame)
##  $ year          : int [1:336776] 2013 2013 2013 2013 2013 2013 2013 2013 2013 2013 ...
##  $ month         : int [1:336776] 1 1 1 1 1 1 1 1 1 1 ...

##   ..   country = col_character(),
##   ..   faa = col_character(),
##   ..   icao = col_character(),
##   ..   lat = col_double(),
##   ..   lon = col_double(),
##   ..   alt = col_double(),
##   ..   tz = col_double(),
##   ..   dst = col_character(),
##   ..   tzone = col_character()
##   .. )
```

2. Find names of airports within NYC

```
#NYC shapefile
nyc=st_read('nyc.shp')
```

```
## Reading layer ‘nyc’ from data source
##   ‘/Users/hang/Semester files/GEO 511/GEO-511-2022/week_04/case_study/nyc.shp’
##   using driver ‘ESRI Shapefile’
## Simple feature collection with 5 features and 4 fields
## Geometry type: MULTIPOLYGON
## Dimension:     XY
## Bounding box:  xmin: -74.25559 ymin: 40.49613 xmax: -73.70001 ymax: 40.91553
## Geodetic CRS:  WGS84(DD)
```

```
nyc_crs=st_crs(nyc)
#Airports shapefile
airports=st_as_sf(airports,coords=c('lon','lat'))
airports=st_set_crs(airports,nyc_crs)
#Logic choose
is_in=st_within(airports,nyc)
is_in=as.numeric(is_in)
bool=!is.na(is_in)
airports_nyc=airports[bool,]
#Names for airports within NYC
names=airports_nyc$faa
names
```

```
## [1] "IDL" "JFK" "JRA" "JRB" "LGA" "NYC" "TSS" "ZYP"
```

#3. Process data and find result

```
farthest_distance_df <- flights %>%
  filter(origin %in% names)%>%
  group_by(origin)%>%
  summarise(distance=max(distance))%>%
  arrange(desc(distance))
farthest_distance_df
```

```
## # A tibble: 2 x 2
##   origin distance
##   <chr>     <dbl>
## 1 JFK        4983
## 2 LGA        1620
```

Since 4983>1620, we could just find that air line.

```
result <- left_join(farthest_distance_df[1,],flights,by=c("origin","distance")) %>%
  select(c('origin','distance','dest'))%>%
  unique()%>%
  left_join(airports,by=c('dest'='faa'))%>%
  select(c("dest",'name'))

result
```

```
## # A tibble: 1 x 2
##   dest  name
##   <chr> <chr>
## 1 HNL   Honolulu Intl
```
